

CR-Analogue of Siu- $\partial\bar{\partial}$ -formula and
Applications to Rigidity problem for
pseudo-Hermitian harmonic maps

SONG-YING LI AND DUONG NGOC SON

2019

第 1 章 Siu- $\partial\bar{\partial}$ 公式的 CR 类比 [1]

1.1 引言

映射 $f : M \rightarrow N$ 称为调和的, 若

$$g^{ij}(\frac{\partial^2 \phi^\alpha}{\partial x^i \partial x^j} - \Gamma_{ij}^k \phi_k^\alpha + \tilde{\Gamma}_{\beta\gamma}^\alpha \phi_i^\beta \phi_j^\gamma) = 0,$$

即

$$\tau(\phi)^\alpha = \Delta \phi^\alpha + \tilde{\Gamma}_{\beta\gamma}^\alpha \phi_i^\beta \phi_j^\gamma g^{ij} = 0.$$

在严格拟凸的 pseudo-Hermitian 流形 $(M^{2m+1}, T_{1,0}(M), \theta, h)$ 上面可以定义许多 Laplace 型算子, 如 Laplace-Beltrami Δ , sub-Laplacian Δ_b , Kohn-Laplacian 等. 由此可提出相应的几类广义的调和映射的概念, 如由 Δ_b 定义的 pseudo-harmonic maps 已经有许多相关研究.

这篇文章利用 Kohn-Laplacian 定义了 **pseudo-Hermitian harmonic maps** 的概念, 然后研究类似于 Siu 型的刚性定理.

定理 1.1 (Siu 刚性定理^[2]) 设 $f : M \rightarrow N$ 为 Kähler 流形之间的调和映射. 如果 M 紧致无边, N 具有强负曲率 (strong negative curvature), 且 $\text{rank}_{\mathbb{R}}(df)_p \geq 4$, 则 f 为全纯或反全纯.

结合 Eells-Sampson 存在性定理可得到具有强负曲率紧 Kähler 流形的刚性定理, 即拓扑等价 (同伦等价) 蕴含全纯等价.

记 $(M^{2m+1}, T_{1,0}(M), \theta, h)$ 为严格拟凸的 pseudo-Hermitian 流形, (N^n, g) 为 Kähler 流形. 考虑光滑映射 $f : M \rightarrow N$. 定义 f 的 $\bar{\partial}_b$ -能量泛函如下:

$$E[f] = \int_M g_{\alpha\bar{\beta}} f_i^\alpha f_j^{\bar{\beta}} h^{j\bar{i}} \theta \wedge (d\theta)^m, \quad (1.1)$$

其中 $\theta \wedge (d\theta)^m$ 为 M 上的一个体积元.

仿照^[3], 约定如下的记号:

$$f_{i|\bar{j}}^\alpha = f_{i\bar{j}}^\alpha + {}^N \Gamma_{\sigma\rho}^\alpha f_i^\sigma f_{\bar{j}}^{\bar{\rho}}; \quad (1.2)$$

$$B_{i\bar{j}} f^\alpha = f_{i|\bar{j}}^\alpha - \frac{1}{m} \left(f_{k|\bar{l}}^\alpha h^{k\bar{l}} \right) h_{i\bar{j}}; \quad (1.3)$$

$$P_i f^\alpha = f_{\bar{j}|\bar{l}i}^\alpha h^{l\bar{j}} + 2m\sqrt{-1} A_i^{\bar{j}} f_{\bar{j}}^\alpha; \quad (1.4)$$

$$Pf = (P_i f^\alpha) \theta^i \otimes \tilde{\eta}_\alpha. \quad (1.5)$$

根据这个记号,

$$f_{i\bar{j}}^\alpha = Z_{\bar{j}} Z_i f^\alpha - \Gamma_{\bar{j}i}^k f_k^\alpha,$$

其中, $\{Z_j, Z_{\bar{j}}, T\}$ 为 $T_{\mathbb{C}}(M)$ 一组局部基 (T 为 Reeb 向量场). 类似地, $f_{\bar{j}|i|k}^\alpha$ 为 $DD\bar{\partial}_b f$ 的张量系数. 这里, D 是由 M 上 Tanaka-Webster 联络和 N 上的 Levi-Civita 联络诱导的.

注 1.1 由 (1.4) 定义的 Pf 被称为 Paneitz 算子, 在 [4] 中已经引入.

可以定义:

$$\langle Pf, \bar{\partial}_b \bar{f} \rangle := g_{\alpha\bar{\rho}} (P_i f^\alpha) f_{\bar{j}}^{\bar{\rho}} h^{i\bar{j}}$$

以及

$$|B_{i\bar{j}} f^\alpha|^2 := g_{\alpha\bar{\rho}} (B_{i\bar{j}} f^\alpha) \overline{(B_{k\bar{l}} f^\rho)} h^{i\bar{k}} h^{l\bar{j}}.$$

下面给出本文的主定理.

定理 1.2 设 (M^{2m+1}, θ) 为闭 (紧致无边) pseudo-Hermitian CR 流形, (N^n, g) 为一 Kähler 流形, $f: M \rightarrow N$ 为光滑映射. 则

$$-\frac{m-1}{m} \int_M \langle Pf, \bar{\partial}_b \bar{f} \rangle = \int_M |B_{i\bar{j}} f^\alpha|^2 + \int_M R_{\rho\bar{\delta}\gamma\bar{\rho}} f_{\bar{l}}^{\bar{\rho}} f_{\bar{j}}^{\rho} (f_i^{\gamma} f_k^{\bar{\delta}} - f_k^{\gamma} f_i^{\bar{\delta}}) h^{i\bar{l}} h^{k\bar{j}}, \quad (1.6)$$

以及

$$-\int_M \langle Pf, \bar{\partial}_b \bar{f} \rangle = \int_M \langle \tau[f], \overline{\tau[f]} \rangle - \sqrt{-1}m \int_M g_{\alpha\bar{\rho}} A^{i\bar{j}} f_{\bar{i}}^{\alpha} f_{\bar{j}}^{\bar{\rho}}. \quad (1.7)$$

推论 1.1 设 (M^{2m+1}, θ) 为闭 pseudo-Hermitian CR 流形, 维数大于等于 5, (N^n, g) 为一 Kähler 流形. 则

(a) 若 N 具有强半负曲率 (strongly semi-negative curvature), 则有

$$\int_M \langle Pf, \bar{\partial}_b \bar{f} \rangle = \int_M g_{\alpha\bar{\rho}} (P_i f^\alpha) f_{\bar{j}}^{\bar{\rho}} h^{i\bar{j}} \theta \wedge (d\theta)^m \leq 0,$$

其中 $f: M \rightarrow N$ 为任一光滑映射. 等号成立当且仅当 f 为 CR-pluriharmonic.(?)

(b) 若 M 上的 pseudohermitian 挠率为零, N 具有强负曲率, 且 f 为 pseudo-Hermitian harmonic, 满足 $\text{rank}_{\mathbb{R}}(df|_H)_p \geq 4$ 于一稠密子集, 则 f 必为 CR-holomorphic 或者 anti CR-holomorphic.

注 1.2 称曲率张量 $R_{\alpha\bar{\rho}\gamma\bar{\delta}}$ 为强负的 ([2]), 若

$$R_{\alpha\bar{\rho}\gamma\bar{\delta}} (A^\alpha \overline{B^\beta} - C^\alpha \overline{D^\beta}) \overline{(A^\delta \overline{B^\gamma} - C^\delta \overline{D^\gamma})} > 0,$$

其中 $A^\alpha \overline{B^\beta} - C^\alpha \overline{D^\beta}$ 不全为零.

1.2 调和映射方程

泛函 (1.1) 的 E-L 方程推导:

给定一点 $p \in M$, 选取一个邻域 V , s.t. $f(V) \subset U$, 其中 (U, φ) 为 $q = f(p)$ 附近的坐标图. 在 V 上考虑一族函数 $f_t^\alpha = f^\alpha + t\phi^\alpha$, ϕ 为 V 上具有紧支集的光滑函数. 则

$$\frac{d}{dt}E(f_t) = \frac{d}{dt} \int_V g_{\alpha\bar{\beta}}(f + t\phi)(f_{\bar{i}}^\alpha + t\phi_{\bar{i}}^\alpha)(f_j^{\bar{\beta}} h^{j\bar{i}} + t\phi_j^{\bar{\beta}} h^{j\bar{i}}).$$

注 1.3 注意, 这里 $f + t\phi$ 的定义为

$$\varphi^{-1}[\varphi \circ f(x) + t\phi(x)].$$

于是

$$\begin{aligned} \frac{d}{dt}E(f_t)|_{t=0} &= \int_V (\partial_{w^\gamma} g_{\alpha\bar{\beta}} \cdot \phi^\gamma + \partial_{w^{\bar{\gamma}}} g_{\alpha\bar{\beta}} \cdot \phi^{\bar{\gamma}}) f_{\bar{i}}^\alpha f_j^{\bar{\beta}} h^{j\bar{i}} \\ &\quad + \int_V g_{\alpha\bar{\beta}} \phi_{\bar{i}}^\alpha f_j^{\bar{\beta}} h^{j\bar{i}} + \int_V g_{\alpha\bar{\beta}} f_{\bar{i}}^\alpha \phi_j^{\bar{\beta}} h^{j\bar{i}}. \end{aligned} \quad (1.8)$$

由散度定理可知

$$\int_V (g_{\alpha\bar{\beta}} f_{\bar{i}}^\alpha \phi_j^{\bar{\beta}})_j h^{j\bar{i}} = 0. \quad (1.9)$$

于是

$$\begin{aligned} \int_V g_{\alpha\bar{\beta}} f_{\bar{i}}^\alpha \phi_j^{\bar{\beta}} h^{j\bar{i}} &= - \int_V \left(\frac{\partial g_{\alpha\bar{\beta}}}{\partial w^\gamma} f_j^\gamma + \frac{\partial g_{\alpha\bar{\beta}}}{\partial w^{\bar{\gamma}}} f_j^{\bar{\gamma}} \right) f_{\bar{i}}^\alpha \phi^{\bar{\beta}} h^{j\bar{i}} \\ &\quad - \int_V g_{\alpha\bar{\beta}} f_{\bar{i}j}^\alpha \phi^{\bar{\beta}} h^{j\bar{i}} \end{aligned} \quad (1.10)$$

再利用

$$g_{\alpha\bar{\epsilon}} \Gamma_{\bar{\beta}\bar{\gamma}}^{\bar{\alpha}} = \partial g_{\epsilon\bar{\beta}} / \partial \bar{z}^\gamma$$

以及

$$f_{i|\bar{j}}^\alpha = f_{i\bar{j}}^\alpha + \Gamma_{\sigma\rho}^\alpha f_i^\sigma f_{\bar{j}}^\rho$$

化简 (1.8) 可得

$$\frac{d}{dt}E(f_t)|_{t=0} = - \int_M \langle \phi^\alpha \tilde{\eta}_\alpha + \phi^{\bar{\alpha}} \tilde{\eta}_{\bar{\alpha}}, \tau^\alpha[f] + \bar{\tau}^\alpha[f] \rangle,$$

其中

$$\tau[f] = \tau^\alpha[f] \tilde{\eta}_\alpha := h^{j\bar{i}} \underbrace{(f_{i\bar{j}}^\alpha + \Gamma_{\beta\gamma}^\alpha f_{\bar{i}}^\beta f_j^\gamma)}_{f_{i|\bar{j}}^\alpha} \tilde{\eta}_\alpha = 0. \quad (1.11)$$

注 1.4 另一个角度解释 (1.9): 定义 1-form θ :

$$\theta(X) := g(\bar{\partial}_b f(X), \phi^{\bar{\alpha}} \tilde{\eta}_{\bar{\alpha}}) = \langle \bar{\partial}_b f(X), \phi^{\bar{\alpha}} \tilde{\eta}_{\bar{\alpha}} \rangle.$$

那么

$$\begin{aligned} \delta(\theta) &= -(\nabla_{\eta_j} \theta)(\eta_{\bar{j}}) - (\nabla_{\eta_{\bar{j}}} \theta)(\eta_j) \\ &= -\eta_j \langle \bar{\partial}_b f(\eta_{\bar{j}}), \phi^{\bar{\alpha}} \tilde{\eta}_{\bar{\alpha}} \rangle + \langle \bar{\partial}_b f(\nabla_{\eta_j} \eta_{\bar{j}}), \phi^{\bar{\alpha}} \tilde{\eta}_{\bar{\alpha}} \rangle - 0 \\ &= \dots \end{aligned}$$

注 1.5 另外, 也可以用如下的方法计算 (1.9):

利用

$$\begin{aligned} g_{\alpha\bar{\beta}}|_j &= 0 \\ \phi_{|j}^{\bar{\beta}} &= \phi_j^{\bar{\beta}} + f_j^{\bar{\epsilon}} \Gamma_{\bar{\epsilon}\bar{\gamma}}^{\bar{\beta}} \phi^{\bar{\gamma}}, \end{aligned}$$

其中 $\phi^{\bar{\beta}}$ 视为 $\sum_{\beta} \phi^{\bar{\beta}} \cdot f^* \tilde{\eta}_{\bar{\beta}}$ 的系数. 可得

$$\int_V g_{\alpha\bar{\beta}} f_{\bar{i}}^{\alpha} \phi_j^{\bar{\beta}} h^{j\bar{i}} = - \int_V g_{\alpha\bar{\beta}} f_{\bar{i}|j}^{\alpha} \phi^{\bar{\beta}} h^{j\bar{i}} - \int_V \partial_{w^{\bar{\gamma}}} g_{\alpha\bar{\beta}} \phi^{\bar{\gamma}} f_{\bar{i}}^{\alpha} f_j^{\bar{\beta}} h^{j\bar{i}}.$$

将上式带入 (1.8) 也能得到 (1.11).

定义 1.1 称 f 为

(i) pseudo-Hermitian harmonic map, 若 $\tau[f] = 0$, 即

$$h^{j\bar{i}} \left(f_{\bar{i}j}^{\alpha} + \Gamma_{\beta\gamma}^{\alpha} f_{\bar{i}}^{\beta} f_j^{\gamma} \right) e_{\alpha} = 0;$$

(ii) $\bar{\partial}_b$ -pluriharmonic map, 若

$$\left(f_{\bar{i}j}^{\alpha} + \Gamma_{\beta\gamma}^{\alpha} f_{\bar{i}}^{\beta} f_j^{\gamma} \right) \theta^{\bar{i}} \wedge \theta^j \otimes e_{\alpha} = 0;$$

(iii) CR-pluriharmonic map, 若 $m \geq 2$, 且 $B_{i\bar{j}} f^{\alpha} = 0, \forall 1 \leq i, j \leq m; 1 \leq \alpha \leq n$. 即

$$f_{\bar{i}j}^{\alpha} + \Gamma_{\beta\gamma}^{\alpha} f_{\bar{i}}^{\beta} f_j^{\gamma} = \frac{\tau^{\alpha}[f]}{m} h_{j\bar{i}}. \quad (1.12)$$

注 1.6 (a) 易见, $\bar{\partial}_b$ -pluriharmonic $\iff$

pseudo-Hermitian harmonic + CR-pluriharmonic .

(b) CR map $\Rightarrow \bar{\partial}_b$ -pluriharmonic. (称 f 为 CR map (anti-CR map) 若 $\bar{\partial}_b f = 0$ ($\partial_b f = 0$).)

(c) 一个 anti-CR map 为 $\bar{\partial}_b$ -pluriharmonic $\iff df(T) = 0$.

命题 1.1 CR-pluriharmonicity 是 CR 不变的.

证明 设 $\hat{\theta} = e^{2\phi}\theta$. 可选取 (cf. [5])

$$\hat{\theta}^k = e^\phi(\theta^k + 2\sqrt{-1}\phi^k\theta)$$

作为对应于 $\hat{\theta}$ 的容许余标架, 其对偶标架为 $\{\hat{Z}_k = e^{-\phi}Z_k\}$. 则有

$$\hat{h}_{i\bar{j}} = h_{i\bar{j}}.$$

在此标架下计算相应的联络系数, 即可验证若 f 为 $(M^{2m+1}, T_{1,0}(M), \theta, h)$ 上的 CR-pluriharmonic map, 则相应于 $\hat{\theta}$ 的 (1.12) 依旧成立. $\blacksquare$

1.3 定理 1.2 的证明

首先, 计算交换公式.

引理 1.1

$$\begin{aligned} f_{j|\bar{k}}^\alpha - f_{\bar{k}|j}^\alpha &= 2\sqrt{-1}f_0^\alpha h_{j\bar{k}} \\ f_{0|\bar{j}}^\alpha - f_{\bar{j}|0}^\alpha &= f_k^\alpha A_{\bar{j}}^k \\ f_{i|\bar{j}|\bar{k}}^\alpha &= f_{i|\bar{k}|\bar{j}}^\alpha - f_i^\beta f_{\bar{j}}^\gamma f_{\bar{k}}^{\bar{\sigma}} \tilde{R}_{\beta\gamma\bar{\sigma}}^\alpha + f_i^\beta f_{\bar{k}}^\gamma f_{\bar{j}}^{\bar{\sigma}} \tilde{R}_{\beta\gamma\bar{\sigma}}^\alpha + 2\sqrt{-1}f_l^\alpha h_{i\bar{j}} A_{\bar{k}}^l - 2\sqrt{-1}f_l^\alpha h_{i\bar{k}} A_{\bar{j}}^l \\ f_{i|\bar{j}|\bar{k}}^\alpha &= f_{i|\bar{k}|\bar{j}}^\alpha - f_i^\beta f_{\bar{j}}^\gamma f_{\bar{k}}^{\bar{\sigma}} \tilde{R}_{\beta\gamma\bar{\sigma}}^\alpha + f_i^\beta f_{\bar{k}}^\gamma f_{\bar{j}}^{\bar{\sigma}} \tilde{R}_{\beta\gamma\bar{\sigma}}^\alpha + f_l^\alpha R_{i\bar{j}\bar{k}}^l + 2\sqrt{-1}f_{i0}^\alpha h_{j\bar{k}} \\ f_{i|\bar{j}|\bar{k}}^\alpha &= f_{i|\bar{k}|\bar{j}}^\alpha - f_i^\beta f_{\bar{j}}^\gamma f_{\bar{k}}^{\bar{\sigma}} \tilde{R}_{\beta\gamma\bar{\sigma}}^\alpha + f_i^\beta f_{\bar{k}}^\gamma f_{\bar{j}}^{\bar{\sigma}} \tilde{R}_{\beta\gamma\bar{\sigma}}^\alpha + 2\sqrt{-1}f_{i\bar{l}}^\alpha h_{i\bar{k}} A_{\bar{j}}^{\bar{l}} - 2\sqrt{-1}f_{i\bar{l}}^\alpha h_{i\bar{j}} A_{\bar{k}}^{\bar{l}}. \end{aligned}$$

注 1.7 这里的系数 2 的差别可能来源于 $d\theta = 2\sqrt{-1}h_{i\bar{j}}\theta^i \wedge \theta^{\bar{j}}$ 的不同定义.

接着, 利用交换公式计算

$$D_k(B_{i\bar{j}}f^\alpha) = f_{i|\bar{j}|\bar{k}}^\alpha - \frac{1}{m}f_{l|\bar{l}|\bar{k}}^\alpha h^{l\bar{l}},$$

可得

$$h^{k\bar{j}}D_k(B_{i\bar{j}}f^\alpha) = \frac{m-1}{m}P_i f^\alpha + R_{\rho\bar{\delta}\gamma}^\alpha f_{\bar{j}}^\rho \left(f_i^\gamma f_{\bar{k}}^{\bar{\delta}} - f_{\bar{k}}^\gamma f_i^{\bar{\delta}} \right) h^{k\bar{j}}. \quad (1.13)$$

然后, 定义 M 上的张量

$$E_{\bar{j}} := g_{\alpha\bar{\beta}}f_{\bar{l}}^{\bar{\beta}}(B_{i\bar{j}}f^\alpha)h^{i\bar{l}}$$

计算其散度 (利用 (1.13) 以及 $B_{i\bar{j}}f^\alpha$ 是 trace-free 的):

$$\begin{aligned} E_{\bar{j}}^{\bar{j}} &= g_{\alpha\bar{\beta}}f_{\bar{l}|\bar{k}}^{\bar{\beta}}(B_{i\bar{j}}f^\alpha)h^{i\bar{l}}h^{k\bar{j}} + g_{\alpha\bar{\beta}}f_{\bar{l}}^{\bar{\beta}}(B_{i\bar{j}}f^\alpha)_{|\bar{k}}h^{i\bar{l}}h^{k\bar{j}} \\ &= |B_{i\bar{j}}f^\alpha|^2 + \frac{m-1}{m}\langle Pf, \bar{\partial}_b \bar{f} \rangle + R_{\rho\bar{\delta}\gamma\bar{\beta}}f_{\bar{l}}^{\bar{\beta}}f_{\bar{j}}^\rho \left(f_i^\gamma f_{\bar{k}}^{\bar{\delta}} - f_{\bar{k}}^\gamma f_i^{\bar{\delta}} \right) h^{i\bar{l}}h^{k\bar{j}}. \end{aligned} \quad (1.14)$$

对上式在 M 上积分可得

$$-\frac{m-1}{m} \int_M \langle Pf, \bar{\partial}_b \bar{f} \rangle = \int_M |B_{i\bar{j}} f^\alpha|^2 + \int_M R_{\rho\bar{\delta}\gamma\bar{\beta}} f_{\bar{l}}^{\bar{\beta}} f_{\bar{j}}^{\rho} \left(f_i^{\gamma} f_k^{\bar{\delta}} - f_k^{\gamma} f_i^{\bar{\delta}} \right) h^{i\bar{l}} h^{k\bar{j}},$$

即 (1.6).

为了证明 (1.7), 考虑张量

$$F_{\bar{l}} := g_{\alpha\bar{\beta}} f_{\bar{j}|k}^{\alpha} f_{\bar{l}}^{\bar{\beta}} h^{k\bar{j}}$$

计算其散度:

$$\begin{aligned} F_{\bar{l}}^{\cdot\bar{l}} &= g_{\alpha\bar{\beta}} f_{\bar{j}|k|i}^{\alpha} f_{\bar{l}}^{\bar{\beta}} h^{k\bar{j}} h^{i\bar{l}} + g_{\alpha\bar{\beta}} f_{\bar{j}|k}^{\alpha} f_{\bar{l}|i}^{\bar{\beta}} h^{k\bar{j}} h^{i\bar{l}} \\ &= g_{\alpha\bar{\beta}} \left(P_i f^\alpha - \sqrt{-1} m A_i^{\bar{k}} f_{\bar{k}}^{\alpha} \right) f_{\bar{l}}^{\bar{\beta}} h^{i\bar{l}} + g_{\alpha\bar{\beta}} \tau^{\alpha}[f] \overline{\tau^{\beta}[f]} \end{aligned}$$

对其在 M 上积分即可.

1.4 推论 1.1 的证明

注意到

$$\begin{aligned} &R_{\rho\bar{\delta}\gamma\bar{\beta}} f_{\bar{l}}^{\bar{\beta}} f_{\bar{j}}^{\rho} \left(f_i^{\gamma} f_k^{\bar{\delta}} - f_k^{\gamma} f_i^{\bar{\delta}} \right) h^{i\bar{l}} h^{k\bar{j}} \\ &= \frac{1}{2} R_{\gamma\bar{\delta}\rho\bar{\beta}} \left(f_i^{\gamma} f_k^{\bar{\delta}} - f_k^{\gamma} f_i^{\bar{\delta}} \right) \left(\overline{f_l^{\beta} f_j^{\bar{\rho}} - f_j^{\beta} f_l^{\bar{\rho}}} \right) h^{k\bar{j}} h^{i\bar{l}}, \end{aligned}$$

于是强负曲率 (强半负曲率) 的条件可以利用.

对于结论 (a), 从 (1.8) 可知 (这里用到了 $m \geq 2$)

$$\int_M \langle Pf, \bar{\partial}_b \bar{f} \rangle \leq 0,$$

且等号成立的充要条件是 (1.8) 的右端两项为零. 特别地,

$$B_{i\bar{j}} f^\alpha = 0.$$

结论 (b) 的证明与 Siu 的方法类似. 不同之处: pseudo-Hermitian harmonic map 不具有唯一延拓性.

定理 1.3 设 (M^{2m+1}, θ) 为一闭 pseudohermitian 流形, (N, g) Kähler 流形, $f: M \rightarrow N$ 为 pseudo-Hermitian harmonic map. 假设 M 的 pseudo-Hermitian 挠率为零, N 具有强负曲率, 且 $\text{rank}_{\mathbb{R}}(df|_H) \geq 4$ 于一稠密子集. 则 f 必为 CR map 或者 anti-CR map. 此外, 若 f 是浸入, 则 f 必须是 CR map. 更一般地, 若 N 的曲率为负 k 阶 (negative of order k), 且 $\text{rank}_{\mathbb{R}}(df|_H) \geq 2k$ 于一稠密子集, 则同样的结论成立.

注 1.8 由于强负曲率蕴含曲率为负 2 阶^[2], 推论 1.1 的结论 (b) 可由上述定理推出.

这里简述一下证明.

第一步, 先证明 (Siu 的方法): 假设 $\text{rank}_{\mathbb{R}}(df|_H) \geq 4$ 在点 $p \in M$ 成立, 则存在 p 的一个连通开集 V , 使得 $f_i^\alpha \equiv 0$ 于 V 或者 $f_i^\alpha \equiv 0$ 于 V .

第二步, 我们需要如下引理.

引理 1.2 设 M 是一个严格拟凸的 CR 流形, 维数至少为 5. 假设 M 在每一点都存在一个 (局部) transversal infinitesimal CR automorphism X . 设 g 是 M 上的一个二阶可微函数, 并且对于任意 $p \in M$, 要么 $\partial_b g(p) = 0$, 要么 $\bar{\partial}_b g(p) = 0$. 则 g 要么是 CR function, 要么是 anti-CR function.

注 1.9 (M, θ) 的 pseudo-Hermitian 挠率为零 $\iff T$ 为一个 infinitesimal CR automorphism^[6].

证明 设 A_0 和 B_0 分别为集合 $\{\partial_b g = 0\}$ 和 $\{\bar{\partial}_b g = 0\}$ 的内部的闭包, 则 $A_0 \cup B_0 = M$. 假设 A_0 和 B_0 均非空 (否则引理结论成立), 下面可以证明 g 为常数.

首先, 由挠率的定义以及 pseudo-Hermitian 挠率为零可得

$$[Z_{\bar{j}}, Z_i] = 2\sqrt{-1}h_{i\bar{j}}T + \Gamma_{\bar{j}i}^l Z_l - \Gamma_{i\bar{j}}^{\bar{l}} Z_{\bar{l}}, \quad (1.15)$$

$$[Z_j, Z_i] = \Gamma_{ji}^k Z_k - \Gamma_{ij}^{\bar{k}} Z_{\bar{k}}, \quad (1.16)$$

$$[Z_j, T] = -\Gamma_{0j}^k Z_k. \quad (1.17)$$

令 $K = A_0 \cap B_0, p \in K$. 从 (1.15) 容易看出 $Tg = 0$ 于 K . 定义

$$G(p) = \begin{cases} 0 & \text{if } p \in B_0 \\ Tg(p) & \text{if } p \in A_0 \end{cases}$$

由粘合引理可知, G 在 M 上连续. 由 (1.17) 易见 $Z_j(G) = 0$ 于 A_0 , 于是 $Z_j(G) \equiv 0$ 于 M .

注意到 M 可局部嵌入到 $\mathbb{C}^{m+1}$, anti-CR functions 具有唯一延拓性 (cf. [7]). 由此可得 $G \equiv 0$ 于 M . 于是 $Tg = 0$ 于 A_0 . 同理, 由 $Tg = \overline{Tg}$ 可知, $Tg = 0$ 于 B_0 . 所以

$$Tg = 0 \quad \text{on } M. \quad (1.18)$$

从 (1.18) 和 (1.15) 可以看出

$$g_{i,\bar{j}} = g_{\bar{j},i}$$

上式左端于 A_0 为零, 右端于 B_0 为零, 从而 $g_{i,\bar{j}} = g_{\bar{j},i} = 0$ 于 M . 由此可知, g 为常数. ■

第三步, 将引理运用于 f^α , 则得 f 为 CR map 或者 anti-CR map.(?)

最后, 假设 f 为 anti-CR map, 即 $f_j^\alpha = 0$. 则

$$f_0^\alpha = \frac{\sqrt{-1}}{m} \left(f_{\bar{i}|j}^\alpha - f_{j|\bar{i}}^\alpha \right) h^{j\bar{i}} = 0.$$

上式在 f 为浸入的情况下不能成立.
